

2.5 - The Inverse Function

Math 2 Honors - Santowski

Lesson Objectives

- Find the inverse of a function from numeric/tabular, graphic or algebraic data
- Use the horizontal line test to determine whether the inverse is a function
- Understand inverses as transformations
- Compose a function with its inverse to develop the identity function

2

Math 2 Honors - Santowski

8/25/2009

Fast Five

- 1. You have the functions $y = f(x)$ and $y = g(x)$ as follows:

$$f(x) = x - 2 \text{ and } g(x) = x^2 - x + c$$

- (a) Determine the domain and range of $y = g(x)$
- 2. Now you will work with the function $y(x) = \frac{f(x)}{g(x)}$
- (a) Determine the value of c such that:
 - (i) the domain of $y(x)$ is infinite
 - (ii) the domain of $y(x)$ has only one restriction
 - (iii) what would happen on the graph of $y(x)$ if $c = -6$

(A) Inverses - The Concept

- Let's back to our input \rightarrow output notion for functions.
- If functions are nothing more than input/output operators, then the concept of an inverse has us considering how to go in reverse \rightarrow how do you get from the output back to the input?

4

Math 2 Honors - Santowski

8/25/2009

(B) Inverses - An Example of the Concept

- Consider is the idea of a relationship between $^{\circ}\text{F}$ and $^{\circ}\text{C}$ \rightarrow the relationship says that if we know $^{\circ}\text{C}$ we can convert to $^{\circ}\text{F}$ by means of the simplified formula double the temperature in $^{\circ}\text{C}$ and add 30° .
- If we work with this simplified formula, we can generate ordered pairs, (or tables of graphs) \rightarrow Order pairs would include $(-10,10)$, $(0,30)$, $(10,50)$, $(20,70)$, $(30,90)$
- in our input/output formula idea we would have: input \rightarrow times 2 \rightarrow add 30 \rightarrow output
- if we wish to discuss the idea of an inverse, we would ask "how do we go from $^{\circ}\text{F}$ back to $^{\circ}\text{C}$?"
- So to express the inverse, we would switch or reverse the ordered pairs or our input/output notion \rightarrow ordered pairs are $(10,-10)$, $(30,0)$, $(50,10)$, $(70,20)$, $(90,30)$ etc....
- Our input/output formula idea would have us: do WHAT??

5

Math 2 Honors - Santowski

8/25/2009

(C) Definition of an Inverse

- A function is a correspondence or relationship between the elements of two sets of numbers, which may be expressed as set of ordered pairs, tables, graphs or formulas.
- If the elements of the ordered pairs or mappings are reversed, the resulting set of ordered pairs or mappings are referred to as the INVERSE.
- Another point worth noting: the domain of the original function now becomes the range of the inverse; likewise, the range of the original becomes the domain of the inverse.

6

Math 2 Honors - Santowski

8/25/2009

(D) Notation of the Inverses

- The notation used for the inverses of functions is $f^{-1}(x)$.
- IMPORTANT NOTE: $f^{-1}(x)$ does not mean $(f(x))^{-1}$ or $1/f(x)$.

7

Math 2 Honors - Santowski

8/25/2009

(E) Inverses as Transformations

- Place the ordered pairs on the Cartesian plane and we see the relationship between the original ordered pairs and the transformed ordered pairs of the inverse
- The relationship that exists is that the original points are reflected in the line $y = x$.

8

Math 2 Honors - Santowski

8/25/2009

(F) Determining Equations of Inverses

- Let's start with the ordered pairs of the linear relation as follows:
- (2,8), (4,9), (8,11) (-2,6), (-6,4)
- By considering our slope \rightarrow a rise of 2 over a run of 1 \rightarrow then use a point to find y-intercept of 7 \rightarrow the equation relating the ordered pairs is $y = 0.5x + 7$
- the ordered pairs of the inverse will be (8,2), (9,4), (11,8), (6,-2), (4,-6)
- By considering our slope \rightarrow a rise of 2 over a run of 1 \rightarrow then use a point to find the y-intercept of $-14 \rightarrow$ the equation of the inverse is $y = 2x - 14$

9

Math 2 Honors - Santowski

8/25/2009

(F) Determining Equations of Inverses

- Let's start with the ordered pairs of the following relation:
- (0,-3), (1,-2), (2,1) (3,6), (4,13)
- Look for a pattern in the data \rightarrow can you find a mathematical relationship between x & y?
- the ordered pairs of the inverse will be (-3,0), (-2,1), (1,2), (6,3), (13,4)
- So can you find a mathematical relationship between x & y in this inverse relation?
- Alternatively, can you find some algebraic method of "undoing" your mathematical relationship from before?

10

Math 2 Honors - Santowski

8/25/2009

(F) Determining Equations of Inverses

- Let's start with the ordered pairs of the following relation:
- (0,2), (2,5), (4,17) (6,65), (8,257)
- Look for a pattern in the data \rightarrow can you find a mathematical relationship between x & y?
- the ordered pairs of the inverse will be (2,0), (5,2), (4,17), (65,6), (257,8)
- So can you find a mathematical relationship between x & y in this inverse relation?
- Alternatively, can you find some algebraic method of "undoing" your mathematical relationship from before?

11

Math 2 Honors - Santowski

8/25/2009

(F) Algebraic Method For Determining Equations

- How can I manipulate $y = 2x + 7$ to get $y = 2x - 14$, or the reverse, how can I manipulate $y = 2x - 14$ to get $y = 2x + 7$?
- Since forming the inverse involved switching the order of an ordered pairs ($x \leftrightarrow y$) then let's try this for the algebraic approach
- If $y = \frac{1}{2}x + 7 \rightarrow$ then $x = \frac{1}{2}y + 7 \rightarrow$ So $x - 7 = \frac{1}{2}y$
- And thus $2x - 14 = y$ which was the equation of our inversed ordered pairs
- Thus the algebraic method is to switch the x and y and then solve the resultant equation for y.

12

Math 2 Honors - Santowski

8/25/2009

(F) Algebraic Method For Determining Equations

- How can I manipulate $y = x^2 - 3$ to get $y = \sqrt{x + 3}$, or the reverse, how can I manipulate $y = \sqrt{x + 3}$ to get $y = x^2 - 3$?
- Since forming the inverse involved switching the order of an ordered pairs ($x \leftrightarrow y$) then let's try this for the algebraic approach
- If $y = x^2 - 3 \rightarrow$ then $x = y^2 - 3 \rightarrow$ So $x + 3 = y^2$
- And thus $y = \sqrt{x + 3}$ which was the equation of our inversed ordered pairs
- Thus the algebraic method is to switch the x and y and then solve the resultant equation for y.

13

Math 2 Honors - Santowski

8/25/2009

(F) Algebraic Method For Determining Equations

- How can I manipulate $y = 2^x + 1$ to get the inverse?
- Since forming the inverse involved switching the order of an ordered pairs ($x \leftrightarrow y$) then let's try this for the algebraic approach
- If $y = 2^x + 1 \rightarrow$ then $x = 2^y + 1 \rightarrow$ So $x - 1 = 2^y$
- And now we need to "unexponentiate" 2^y ?????? But how???
- Thus the algebraic method is to switch the x and y and then solve the resultant equation for y.

14

Math 2 Honors - Santowski

8/25/2009

(G) Examples

- Ex. Determine the equation for the inverse of $y = 4x - 9$. Draw both graphs and find the D and R of each.
- Ex. Determine the equation for the inverse of $y = 2x^2 + 4$. Draw both and find D and R of each.
- Ex. Determine the eqn for the inverse of $y = 2 - \sqrt{x+3}$. Draw both and find the domain and range of each.
- Ex. Determine the eqn of the inverse of $y = x^2 + 4x - 2$. Draw both and find the domain and range of each.

15

Math 2 Honors - Santowski

8/25/2009

(G) Examples

- ex 2. Consider a graph of the following data:
- 1. State do domain and range of f
- 2. Evaluate $f(-2)$, $f(0)$, $f^{-1}(1)$, $f^{-1}(-2)$
- 3. Graph the inverse
- 4. Is the inverse a function?
- 5. State the domain and range of $f^{-1}(x)$

- Here is the graph of $f(x)$

16

Math 2 Honors - Santowski

8/25/2009

(G) Examples

- ex . The cost of renting a car for a day is a flat rate of \$40 plus \$0.10/km
- 1. Write a function $r(d)$ to represent the total cost of a one day rental. State restrictions on domain and range.
- 2. Find the equation of the inverse. What does the equation of the inverse represent?
- 3. Give an example of how the inverse could be used?

17

Math 2 Honors - Santowski

8/25/2009

(G) Examples

- ex . If an object is dropped from a height of 80 m, its height above the ground in meters is given by
- $h(t) = -5t^2 + 80$
- 1. Graph the function
- 2. Find and graph the inverse
- 3. Is the inverse a function
- 4. What does the inverse represent?
- 5. After what time is the object 35 m above the ground?
- 6. How long does the object take to fall?

18

Math 2 Honors - Santowski

8/25/2009

(H) Composing with Inverses

- Let $f(x) = 2x - 7$.
- Determine the inverse of $y = f(x)$
- Graph both functions on a grid/graph
- Fold the grid/graph upon the line $y = x$. What do you observe? Why?
- What transformation are we considering in this scenario?
- Now compose as follows $f \circ f^{-1}(x)$ and $f^{-1} \circ f(x)$. What do you notice?
- How is this related to our graph folding exercise?

19

Math 2 Honors - Santowski

8/25/2009

(H) Composing with Inverses

- Now let $f(x) = x^2 + 2$.
- Determine the inverse of $y = f(x)$
- Graph both functions on a grid/graph
- Fold the grid/graph upon the line $y = x$. What do you observe? Why?
- What transformation are we considering in this scenario?
- Now compose as follows $f \circ f^{-1}(x)$ and $f^{-1} \circ f(x)$. What do you notice?
- How is this related to our graph folding exercise?
